Montasr Mohamed CRT

1. The purpose of a loop structure is to repeat a section of code multiple times. It keeps running the code until a certain condition is met.

9. When choosing a loop, you should think about how many times the code needs to repeat, whether you know the number of repetitions, and whether the loop needs to run at least once.

11. Given `String x = "my string";`

a) `x.length()` = 9, because there are 9 characters, including the space.

b) `x.substring(0, 3)` = "my " because it gets the characters from position 0 up to, but not including, position 3.
